HIGH PURITY CARBON AND GRAPHITE FOR SEMICON AND PV INDUSTRIES

ETV-ICP-OES
The most accurate detection limits

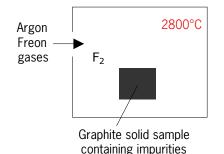

ETV-ICP-OES

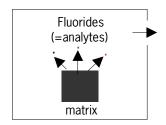

Electro Thermal Vaporization & Inductively Coupled Plasma Optical Emission Spectrometry

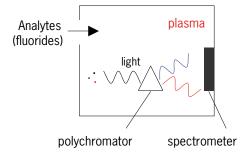

The high-tech applications of graphite (semiconductors, photovoltaics, nuclear...) often require strict control over impurities in the material. After setting the standard for supplying the highest purity graphite in the industry, Carbone Lorraine now offers the most sophisticated method for measuring graphite purity.

The ETV-ICP analytical method has been applied to develop a powerful, rapid and reliable tool for analysing impurity content of solid samples with very low limits of detection. ETV-ICP has proven to be the reference for analysing graphite and can be considered as state-of-theart technique.

 F_2 + impurities \rightarrow fluorides

How does it work?

Sampling, loading and heating

The graphite sample (solid or powder) is loaded into a high temperature graphite furnace. The sample is heated up to 2800°C.

Electro Thermal Vaporization

Freon gas and Argon carrier gas circulate in the furnace. The precursor gas decomposes into Fluor (F_2), that reacts with impurities contained in graphite to form fluorides (analytes), and extracts them from the graphite matrix.

Inductively Coupled Plasma

The gas carrying analytes (fluorides with impurities) is introduced into a plasma chamber. Molecules are excited under plasma and emit light with different wavelengths characteristic of each atom of impurity.

Optical Emission Spectrometry

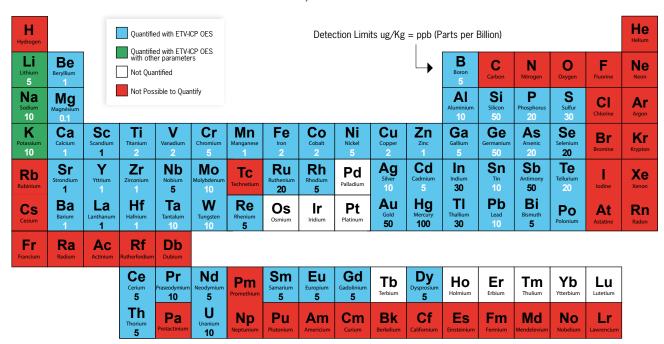

Light is then decomposed by wavelength through a polychromator (prism-like) and analysed by a spectrometer. Light intensity at a given wavelength is directly proportional to the concentration of an atom in the plasma. Thus exact content proportion of each atom can be calculated.

Advantages of the ETV-ICP analytical method

- Contamination-free introduction of samples without sample decomposition or dilution. Solid as well as liquid sampling is possible.
- Sampling and calibration of graphite possible with existing standards and reference solutions, which is not the case with the GDMS method (Glow Discharge Mass Spectrometry).
- Very effective thanks to high transport efficiency of gases used. No spectral interference from the matrix.
- Simple and rapid acquisition: up to 50 samples analysed per day with automatic loading. Suitable for routine analysis.
- Very low limits of detection for most elements of the periodic classification, 1 50 μg/kg = ppb (parts per billion).
- Perfectly adapted to purified graphite, carbon/carbon composite and carbon insulation materials.
- Value-added service for customers.

CUSTOMER-ORIENTED INTERNATIONAL NETWORK

PARTNER IN INNOVATION

Carbone Lorraine harnesses prime expertise in industrial applications to deliver innovative solutions — involving graphite, other high-performance materials, and key components for electric motors and electronic equipment – for many high-technology markets.

As world number-one in its main business specialities,
Carbone Lorraine fields an extensive industrial and commercial
network covering around 40 countries, working hand in hand
with its clients to pursue permanent innovation through a
broad range of top-class products and services.
